Appendix E Monitoring Framework

1 Monitoring Program

The monitoring program presented in the WRMP **Table 3-1** and **Table 3-2** is informed by extensive studies, baseline assessments, and monitoring programs implemented by Alcoa. These works include comprehensive assessments on the hydrology, hydrogeology and ecology in the catchments and development of management plans and procedures designed to avoid, prevent, and mitigate impacts and support effective rehabilitation.

The program was developed with consideration of identified Environmental Values presented in the WRMP **Table 2-3, Table 2-4, Table 2-5** and **Table 2-7,** and informed by the Qualitative Risk Assessment (**Appendix A**) which identified the key risks shown in the WRMP **Section 2.5.2**.

The process for developing the program centres around understanding potential risk from mining activities with a focus on potential **sources** (of contamination), **receptors** (and associated Environmental Values), and **pathways** (from the source to receptors).

Sources of contamination, and specifically COPCs, were informed by detailed interrogation of Alcoa's operational inventories and activities (WRMP **Section 2.5.5**). **Table C1** in **Appendix C** presents the identified sources, COPCs and associated activities considered in the monitoring framework.

The identified COPC then form the basis of the analytical schedules of the monitoring programs in the context of the identified Environmental Values and **receptors**, with the identified values and specific receptors informing the selection of appropriate guidance values presented in **Appendix C** which serve to evaluate:

- potential impacts to public drinking water source areas and water resources;
- potential impacts to surface water and groundwater; and
- potential contamination of water resources.

Identified potential **pathways** inform the selection of monitoring locations between the **sources** and **receptors** across interlinked media (i.e., groundwater and surface water) and mechanisms (e.g., overland flow to surface water and infiltration to groundwater; groundwater to surface water where the water body is gaining; and surface water to groundwater where the surface water body is losing). The selection of locations serves to:

- Establish baseline and background conditions to inform ambient conditions unaffected by mining activities as a point of comparison and natural variability against potential impacts from mining activities;
- monitor locations in the vicinity of potential sources to evaluate effectiveness of management actions, as well as providing a trigger warning mechanism for the implementation of triggers, thresholds and contingency measures required to address operational impacts;
- Monitor locations along the pathway and at points of compliance or receptors to ensure the identified Environmental Values are protected. Implement contingency measures if monitoring indicates thresholds for these values are exceeded.

- monitor locations following cessation of mining and rehabilitation activities to demonstrate efficacy of the Management and Rehabilitation Actions throughout entire lifecycle of the mine.

The suitability and accessibility of selected monitoring locations requires continual evaluation to ensure data collected is fit for purpose. Where locations are not considered suitable for the intended purpose (i.e., inaccessible, compromised integrity, or due to refinement of the conceptual site model regarding source, pathways and receptors), alternate locations are identified as soon as practicable to ensure the intended purpose of the monitoring location is not compromised.

The frequency and timing of monitoring depends on the segment of the environment being monitored, monitoring method available for the specific analyte, rapidity of potential impact, and change in potential risks based on the stages of mining (i.e., establishment of pre-mining conditions, during operations, and during and post rehabilitation). In addition, monitoring frequency takes into account greater frequency based on potential risk and proximity to source to serve as robust early warning mechanisms for triggers and contingency actions to be implemented. The timing of monitoring takes into account the capturing of seasonal variations that may influence COPC behaviour and associated risk.

These elements are discussed in context with the specific Environmental Values in the WRMP **Section 2.**

Table E1 provides a summary of the monitoring provisions (WRMP **Table 3-2**) along with detailed information for the sites monitored and the analytical suites.

Table E1 Monitoring Provisions Summary Table

Grab sample Program	Indicator / Aspect	Frequency	Analysis / Analytical Suite	Sample/ Analysis Type	Sites Monitored	Trigger[20]	Threshold[1]
Surface Water	Water Quality in Catchment	Twice per year – Two years prior to mining operations commencing at baseline sites (where practicable) Once per year – Post rehabilitation completion for two years. Continuous (when flowing) – during mining operations and rehabilitation.	Turbidity	In stream flow meter and grab samples where required	**Huntly (Figure E1)** Installed (note: TDS capability required to be added at the below locations) ND04T, ND14T, SE48T, SE10T, SE52T, SE53T, SE51T, SE59T, PD01T, PD02T, ND06T, DB01T, DB02T, SE60T, SE61T, SE62T, ND07T, SE12T, SE15T, SE07T, SN07T, SE02T, SE06T, SE05T, ND12T, ND13T, SE11T, SE08T, SE03T, SE34T, SE01T, PD03T, SE09T, SE36T, SE22T, SE23T, SE24T, SE25T, SE26T, FPWR1, SE12INV, SE03INV1, SE03INV2, SE03INV3. Additional Proposed SE49T, SN04T, ND02T, SE27T, SE28T, SE29T, SE30T, SE50T, SE04T, DB03T. **Willowdale (Figure E2)** Installed (note: TDS capability required to be added to the below locations) SM07T, SM08T, SM09T, SM06T, SM04T, SM46T, MY50W, DK10T, DK08T, HV08T, HV10T, HV47T, HV16T, LG10T, HV07T, HV49T, HV50T, HV51T, HV52T, HV53T, HV54T, RHB1, RHB2, RHB3	≥25 (NTU) over a rolling one-hour average during flowing conditions at in stream monitoring site.	≥ 1 (NTU) over a rolling one-hour average during flowing conditions at receptor monitoring sites.
			TDS			TDS at in-stream monitoring locations exceeds 600 mg/ based on a rolling 24 hour average.	TDS at in-stream monitoring locations exceeds 1,200 mg/L based on a rolling 24 hour average.
		Twice per year	ADWG and Comprehensive (Table E2)	Grab sample	**Huntly (Figure E3)** Baseline / Reference CNG_ST1_SO1_61, CNG_ST1_SO2_15, MCCOA-UAW1, OEMEA-UAW1, OOA-UAW2, OOA-UAW4, OOA-UAW5, OOA-UAW6, OOA-UAW7, OOA-UAW8, OOA-UAW9, SDC-UAW7, SE_ST1_SO1_19, WGG_ST1_SO1_5, WGG_ST2_SO1_3 Receptor MCCOA-RW1, MOA-RW11, MOA-RW12, MOA-RW17, MOA-RW18, MOA-RW2, MOA-RW3, MOA-RW4, MOA-RW5, MOA-RW6, MOA-RW7, MOA-RW8, MOA-RW9, NDC-RW5, NDC-RW6, NDC-RW7, NDP_ST1_SO2_8, NEW01, NEW14, NEW15, ONDC-RW1, SE_ST1_SO1_22, SE_ST1_SO2_31, SE_ST1_SO3_1, SE_ST20_SO1_1, SE_ST27_SO1_1, SE_ST33_SO1_1, SE_ST5_SO1_3, SE_ST5_SO2_1, SE51, SE52 **Willowdale (Figure E4)** Baseline / Reference HDC-UAW2, LBD_ST1_SO2_1, LBD_ST2_SO1_3, NODAM_ST1_SO1_194, NODAM_ST1_SO1_75, NODAM_ST1_SO1_79, STN_ST1_SO1_10, STN_ST1_SO1_18, STN_ST2_SO2_9 Receptor SDC-RW1, SDC-RW2, SDC-RW3, STN_ST1_SO2_27, STN_ST1_SO2_30, STN_ST1_SO3_16	Statistically significant increasing trends at receptor sites (when sufficient data available to conduct statistical analysis and to establish natural variation) for chemicals from ADGW (2011), ANZG (2018), PFAS NEMP (2020) and NPUG (DoH (2024) and ANZECC (2000) guideline (Appendix C Table C2) and/or monitoring results concentrations are less than and/or within a nominal 15% of the relevant criteria, where insufficient data available to conduct statistical analysis.	Exceedance of health-based ADGW (2011), ANZG (2018), PFAS NEMP (2020) and NPUG (DoH (2024) and ANZECC (2000) guideline (Appendix C Table C2) at receptor sites.
			Microbial (Table E2)		**Huntly Monitoring Sites (Figure E3)** **Baseline / reference** SE_ST20_SO1_1	Background site records >2,000 to 20,000 E. coli per 100 mL (Heavy contamination as per ADWG 2011)	Receiving site records >2,000 to 20,000 E. coli per 100 mL (Heavy contamination as per ADWG

[20] Trigger and threshold values not relevant for background / reference monitoring, however data collected may inform trigger and threshold criteria.

Grab sample Program	Indicator / Aspect	Frequency	Analysis / Analytical Suite	Sample/ Analysis Type	Sites Monitored	Trigger[20]	Threshold[1]

Table E2 Analytical Suite

Analytical Suite Name	Analytes
Microbial	Anionic Surfactants as MBAS, Enterococci, Escherichia coli, 2-Ethoxyethyl acetate, 2-Butoxyethanol, Propylene glycol, Ethylene glycol, Diethylene glycol monobutyl ether, Diethylene glycol, Triethylene glycol, Thermophilic Amoeba, and Volume Analysed
ADWG	turbidity, pH, electrical conductivity, total dissolved solids, nitrate, nitrite, ammonia, total nitrogen, reactive phosphorus, total phosphorus, chloride, sulfate, calcium, magnesium, sodium, potassium, total hardness, and heavy metals like arsenic, cadmium, lead, and mercury,
Comprehensive	DEF, Dibromo-DDE, Dichlorvos, Demeton-S-methyl, Monocrotophos, Dimethoate, Diazinon, Chlorpyrifos-methyl, Parathion-methyl, Malathion, Fenthion, Chlorpyrifos, Parathion, Pirimphos-ethyl, Chlorfenvinphos, Bromophos-ethyl, Fenamiphos, Prothiofos, Ethion, Carbophenothion, Azinphos Methyl, Mercury, C10 - C14 Fraction, C10 - C16 Fraction, C15 - C28 Fraction, C16 - C34 Fraction, C29 - C36 Fraction, C34 - C40 Fraction, C10 - C40 Fraction (sum), C10 - C16 Fraction minus Naphthalene (F2), C10 - C36 Fraction (sum), 1.2-Dichloroethane-D4, Benzene, C6 - C10 Fraction, C6 - C9 Fraction, C6 - C10 Fraction minus BTEX (F1), Toluene, Toluene-D8, 4-Bromofluorobenzene, Ethylbenzene, meta- & para-Xylene, ortho-Xylene, Total Xylenes, Sum of BTEX, Naphthalene, Aluminium, Chromium, Cobalt, Copper, Lead, Manganese, Molybdenum, Arsenic, Nickel, Selenium, Vanadium, Zinc, Barium, Boron, Iron, Cadmium, Turbidity, pH Value, Electrical Conductivity @ 25°C, 2.4-Dichlorophenyl Acetic Acid, 4-Chlorophenoxy acetic acid, 2.4-DB, Dicamba, Mecoprop, MCPA, 2.4-DP, 2.4-D, Triclopyr, Silvex (2.4.5-TP/Fenoprop), 2.4.5-T, MCPB, Picloram, Clopyralid, Fluroxypyr, 2.6-D, 2.4.6-T, Glyphosate, Aldrin, alpha-BHC, beta-BHC, delta-BHC, 4.4'-DDD, 4.4'-DDE, 4.4'-DDT, Dieldrin, alpha-Endosulfan, beta-Endosulfan, Endosulfan sulfate, Endrin, Endosulfan (sum), Endrin aldehyde, Endrin ketone, Heptachlor, Heptachlor epoxide, Hexachlorobenzene (HCB), gamma-BHC (Lindane), Methoxychlor, cis-Chlordane, trans-Chlordane, Total Chlordane (sum), Oxychlordane, Sum of Aldrin + Dieldrin, Sum of DDD + DDE + DDT, Trivalent Chromium, Hexavalent Chromium, 2-Fluorobiphenyl, Naphthalene, Acenaphthylene, Anthracene-d10, 4-Terphenyl-d14, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b+j)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1.2.3.cd)pyrene, Dibenz(a.h)anthracene, Benzo(g.h.i)perylene, Total PAH, Benzo(a)pyrene TEQ (zero), Suspended Solids (SS), Total Dissolved Solids @180°C, Silver, Aluminium, Copper, Lead, Manganese, Molybdenum, Arsenic, Nickel, Selenium, Beryllium, Barium, Boron, Cadmium, Uranium, Total Nitrogen as N, Nitrite as N, Ammonia as N, Nitrate as N, Reactive Phosphorus as P, Total Phosphorus as P, Nitrite + Nitrate as N, Total Kjeldahl Nitrogen as N, Calcium, Magnesium, Sodium, Potassium, Total Hardness as CaCO3, Total Anions, Total Cations, Ionic Balance, Sulfate as SO4 (Turbidimetric), Hydroxide Alkalinity as CaCO3, Carbonate Alkalinity as CaCO3, Bicarbonate Alkalinity as CaCO3, Total Alkalinity as CaCO3, Chloride, Perfluoropropane sulfonic acid (PFPrS), Perfluorobutane sulfonic acid (PFBS), Perfluoropentane sulfonic acid (PFPeS), Perfluorohexane sulfonic acid (PFHxS), Perfluoroheptane sulfonic acid (PFHpS), Perfluorooctane sulfonic acid (PFOS), Perfluorononane sulfonic acid (PFNS), Perfluorodecane sulfonic acid (PFDS), Perfluorobutanoic acid (PFBA), Perfluoropentanoic acid (PFPeA), Perfluorohexanoic acid (PFHxA), Perfluoroheptanoic acid (PFHpA), Perfluorooctanoic acid (PFOA), Perfluorononanoic acid (PFNA), Perfluorodecanoic acid (PFDA), Perfluoroundecanoic acid (PFUnDA), Perfluorododecanoic acid (PFDoDA), Perfluorotridecanoic acid (PFTrDA), Perfluorotetradecanoic acid (PFTeDA), Perfluorooctane sulfonamide (FOSA), N-Methyl perfluorooctane sulfonamide (MeFOSA), N-Ethyl perfluorooctane sulfonamide (EtFOSA), N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE), N-Ethyl perfluorooctane sulfonamidoethanol (EtFOSE), N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA), N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA), 4:2 Fluorotelomer sulfonic acid (4:2 FTS), 6:2 Fluorotelomer sulfonic acid (6:2 FTS), 8:2 Fluorotelomer sulfonic acid (8:2 FTS), 10:2 Fluorotelomer sulfonic acid (10:2 FTS), Sum of PFHxS and PFOS, Sum of PFAS (WA DER List), and Sum of PFAS

Hydrocarbon	Benzene, toluene, ethylbenzene, xylenes, naphthalene (BTEXN); Polycyclic aromatic hydrocarbons (PAHs); Total Petroleum Hydrocarbons (TPH), >C10-C16 Fraction (F2 minus Naphthalene)
Huntly WWTP L6210/1991/10	pH, Total Dissolved Solids, Oil and Grease, Surfactants (as MBAS), Zinc, Total Phosphorus, Chromium, and Copper,
PFAS Compounds	10:2 Fluorotelomer sulfonic acid (10:2 FTS), 4:2 Fluorotelomer sulfonic acid (4:2 FTS), 6:2 Fluorotelomer sulfonic acid (6:2 FTS), 8:2 Fluorotelomer sulfonic acid (8:2 FTS), Perfluoro-1-octanesulfonamidoacetic acid (FOSAA), Perfluorobutanesulfonic acid (PFBS), Perfluorobutanoic acid (PFBA), Perfluorodecanesulfonic acid (PFDS) (free acid), Perfluorodecanoic acid (PFDA), Perfluoroheptanesulfonic acid (PFHpS), Perfluoroheptanoic acid (PFHpA), Perfluorohexane sulfonic acid (PFHxS), Perfluorohexanoic acid (PFHxA), Perfluorononanesulfonic acid (PFNS), Perfluorononanoic acid (PFNA), Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acid (PFOA), Perfluoropentane sulfonic acid (PFPeS), Perfluoropentanoic acid (PFPeA), Perfluorotridecanoic acid (PFTrDA), Perfluoroundecanoic acid (PFUnDA or PFUnA).
DWER Groundwater	pH, Total Dissolved Solids, Chloride, Nitrate, Magnesium, Sodium, Sulfate, Total Recoverable Hydrocarbons, BTEX, Aluminium, Arsenic, Barium, Cadmium, Chromium, Cobalt, Copper, Lead, Manganese, Mercury, Molybdenum, Nickel, Zinc
Willowdale Treatment Ponds	pH, Total Dissolved Solids, Total Suspended Solids, Surfactants as MBAS, Total Phosphorus, Oil and Grease, Total Recoverable Hydrocarbons, Chromium, Copper, Zinc, 6:2 Fluorotelomer Sulfonic Acid (6:2 FTS), 8:2 Fluorotelomer Sulfonic Acid (8:2 FTS), Perfluoro-1-octanesulfonamidoacetic Acid (FOSAA), Perfluorobutanesulfonic Acid (PFBS), Perfluorobutanoic Acid (PFBA), Perfluorodecanesulfonic Acid (PFDS) (free acid), Perfluorodecanoic Acid (PFDA), Perfluoroheptanesulfonic Acid (PFHpS), Perfluoroheptanoic Acid (PFHpA), Perfluorohexane Sulfonic Acid (PFHxS), Perfluorohexanoic Acid (PFHxA), Perfluorononanesulfonic Acid (PFNS), Perfluorononanoic Acid (PFNA), Perfluorooctane Sulfonic Acid (PFOS), Perfluorooctanoic Acid (PFOA), Perfluoropentane Sulfonic Acid (PFPeS), Perfluoropentanoic Acid (PFPeA), Perfluorotridecanoic Acid (PFTrDA), and Perfluoroundecanoic Acid (PFUnDA or PFUnA).

Appendix F Control Self-Assessment

Information regarding the effectiveness of controls is collected through monitoring data (see Appendix D) and through several studies in progress (see table 41). As these programs are still in their early stages, a qualitative self-assessment has been undertaken in the interim to provide an understanding of control effectiveness.

The Control Self-Assessment (CSA) has been developed to detail the key controls' ability to minimise the occurrence and impact of a mining-related drainage incidents

The following is presented:

- The effectiveness of each control in various scenarios
- Anecdotal evidence presented based on Alcoa's historical performance and expected improvement due to current Drainage Design Manual.

Effectiveness of controls is based on a qualitative assessment as per the below:

- Fully Effective - 100% of the time
- Predominately Effective - 75% - 99% of the time
- Average Effectiveness - 50% - 74% of the time
- Partially Effective - 25% - 49% of the time
- Not Effective - 0% - 25% of the time.

Table F1- Control Self Assessment

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
Harvesting debris	Following harvesting, vegetation debris not removed for harvesting remains in-situ, with no impacts to the soil profile. Topsoil acts as a "sponge" and absorbs rainfall due to higher infiltration and absence of significant compaction. The run-off from a harvested area is less than that expected of a cleared, compacted area.	Rainfall event	Vegetation debris assists in dispersing surface water flow and given that the soil profile is not compacted, results in the retention of rainfall events. No recent history of drainage incidents from harvested areas.		Predominantly
		Significant Rainfall Event			Predominantly
		High Slope			Predominantly
		Extended Slope, large pits or upslope catchments (sub-catchment clearing)			Predominantly
		High Groundwater	Vegetation debris assists in dispersing surface water flow and the soil profile is not compacted, resulting in the retention of rainfall events.	• No interactions with groundwater are expected at this stage, as harvested areas are typically cleared within one year of harvesting or vegetation regrows. • Groundwater monitoring and investigations determine groundwater level prior to clearing, which is not within 2 mbgl of harvested profile (ie natural ground)	Predominantly
		Close Proximity to Streamzone	Vegetation debris assists in dispersing surface water flow and the soil profile is not compacted, resulting in the retention of rainfall events.	• 100m Havel vegetation buffer provides a buffer to streamzone vegetation and streams. Further studies (erosional modelling) will confirm effectiveness of buffer distance.	Predominantly
Woody Windrow	Woody windrows are installed prior to any further clearing activities. Woody windrows are developed from remaining vegetation material and are required based on a trigger assessment which considers:	Rainfall event	Effective at dissipating surface water flow and decreasing surface water flow, particularly in combination with DPSs. Topsoil and overburden is still in place (with the exception of DPSs), which has higher infiltration potential.	• Utilised in combination with DPSs • Installed immediately upon vegetation clearing post-harvesting, particularly within winter • Catchment management to ensure surface water run off is contained within cleared areas (ie stockpile positioning, ripping, bunds and/or v-drains).	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
	• Location in relation to water sensitive receptors • Proximity to streams, reservoirs or stream vegetation • Slope • Area size Remaining vegetation material is stockpiled on the contour to dissipate surface water flow. Minimal impacts to the soil profile have occurred, with topsoil acting as a "sponge" and absorbs rainfall due to higher infiltration and absence of significant compaction.	Significant Rainfall Event	There is the potential to create channelling in significant rainfall events, limiting effectiveness to disperse surface water flow. Topsoil and overburden is still in place (with the exception of DPSs), which has higher infiltration potential.	• Utilised in combination with DPSs • Installed immediately upon vegetation clearing post-harvesting, particularly within winter • Catchment management to ensure surface water run off is contained within cleared areas (ie stockpile positioning, ripping, bunds and/or v-drains).	Average
		High Slope	Effective at dissipating surface water flow and decreasing surface water flow, particularly in combination with DPSs. Topsoil and overburden is still in place (with the exception of DPSs), which has higher infiltration potential.	• Utilised in combination with DPSs • Installed immediately upon vegetation clearing post-harvesting, particularly within winter. • Catchment management to ensure surface water run off is contained within cleared areas (ie stockpile positioning, ripping, bunds and/or v-drains).	Average
		Extended Slope, large pits or upslope catchments (sub-catchment clearing)		• Utilised in combination with DPSs • Utilised within large slopes to dissipate surface water flow • Catchment management to ensure surface water run off is contained within cleared areas (ie stockpile positioning, ripping, bunds and/or v-drains).	Average
		High Groundwater	No interactions with groundwater are expected at this stage, as areas are typically cleared within one year.	• Utilised in combination with DPSs • Groundwater monitoring and investigations determine groundwater level prior to clearing. Ongoing groundwater monitoring will confirm a 2 m separation distance or other groundwater management measures will be implemented.	Average
		Close Proximity to Streamzone	Effective at dissipating surface water flow and decreasing surface water flow, particularly in combination with DPS's. Topsoil and overburden is still in place, which has higher	• Utilised in combination with DPSs • Utilised within proximity to stream zones to dissipate surface water flow	Average

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			infiltration potential.		
Drainage Protection Slot	DPS are installed once vegetation, topsoil and overburden is removed. A trigger assessment is completed to determine if a DPS assessment which considers: • Location in relation to water sensitive receptors • Proximity to streams, reservoirs or stream vegetation • Slope • Area size DPS location is dependent on the DPS assessment, which considers: • Proximity to stream zones • Slope • Catchment size • Upslope run length Increased risk does exist in the approximate two-week period once clearing commences and DPS installation, as soil profile compaction has occurred and clay has been backfilled for drill rig installation.	Rainfall event	DPSs have been historically utilised and rarely have drainage failures occurred if installed, maintained and upper catchment appropriately managed. The risk of failure increases once over-burden removed or backfill commenced and prior to DPS install.	• Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required • Clearing preferably occurs outside of winter months • Within winter, woody windrow are installed, then DPS's and then the remaining pit topsoil/over-burden is removed • Outside of winter, topsoil/over-burden removal may occur in portions of the pit, then DPS installation • Alternative controls will be utilised in DPS Catchments with a rating of High	Predominantly
		Prolonged areas open	DPS effectiveness decreases when areas have been open for longer than 12 months, and sedimentation occurs.	• Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required	Predominantly
		Backfill stage (DPS not yet installed)	Backfill stage (without DPSs) only occurs for approximately 2 days, particularly in current clearing environment and over winter. Historically used to be 2 weeks. No drainage incidents have been recorded over the last 5 years for this scenario due to compressed execution timeline and scheduling of activities based on forecasted weather conditions.	• No excess back fill material remains within the pit • Woody windrows are installed in association with DPSs • Monitoring of weather conditions in advance and adapting as required (i.e. delaying/expediting DPS installation based on expected rainfall) • Size of backfill areas is limited and progressively implemented (i.e. staged).	Predominantly
		Significant Rainfall Event	DPSs are designed and executed in accordance with	• Clearing preferably occurs outside of winter months	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			the 1% 24-hour AEP rainfall design event. However for pits with woody windrows removed, backfilled and subject to rainfall events exceeding the 1% 24-hour AEP rainfall design event, there is limited effectiveness.	• DPSs can be installed prior to clearing to minimise risk of surface water run-off, particularly over winter months. • Within winter, woody windrows are installed, followed by DPSs and then the remaining pit topsoil/over-burden is removed • Outside of winter, topsoil/over-burden removal may occur in portions of the pit, then DPS installation • Alternative controls will be utilised in DPS Catchments with a rating of High • Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required	
		High Slope	Mid-slope DPS installation has significant effect to intercept and disperse surface water run-off. Larger DPSs are installed to increase capacity and interception of surface water. No recent events have occurred (since 2021), even in the pit development stage for this scenario.	• Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required • Slope is a contributing factor of DPS assessment and design, with DPSs installed to intercept high slope areas. • Within winter, woody windrow are installed, followed by DPSs and then the remaining pit topsoil/over-burden is removed • Outside of winter, topsoil/over-burden removal may occur in portions of the pit, then DPS installation • Alternative controls will be utilised in DPS Catchments with a rating of High	Predominantly
		Extended Slope, large pits or upslope catchments (sub-catchment clearing)	Mid-slope DPS installation has significant effect to intercept and disperse surface water run-off. Larger DPSs are installed to	• Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			increase capacity and interception of surface water.	• Length of upslope length is a contributing factor of DPS assessment and design, with mid-slope DPSs designed as per Section 2.2.2. • Within winter, woody windrow are installed, followed by DPSs and then the remaining pit topsoil/over-burden is removed • Outside of winter, topsoil/over-burden removal may occur in portions of the pit, then DPS installation • Alternative controls will be utilised in DPS Catchments with a rating of High	
		High Groundwater	No interactions with groundwater are expected at this stage, as areas are typically cleared within one year.	• Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required • Groundwater monitoring and investigations determine groundwater level prior to clearing. Ongoing groundwater monitoring will confirm a 2 m separation distance or other groundwater management measures will be implemented. • Alternative controls will be utilised in DPS Catchments with a rating of High, which may include below ground sumps which allow visual inspections for	Predominantly
		Close Proximity to Streamzone	DPSs have been historically utilised and rarely have drainage failures occurred if correctly designed, installed and maintained, and upper catchment appropriately managed as per the lessons learned outlined in Section 7.1.2.2.	• Ongoing DPS inspections and as-builts (after installation and ongoing) confirm DPS integrity and capacity, with maintenance implemented if required • 100 m Havel vegetation buffer provides a buffer to streamzone vegetation and streams • Alternative controls will be utilised in DPS Catchments with a rating of High	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
In-pit trenches and sumps	Pit capacity is assessed and if required, increased with in-pit trenches and sumps to meet the Drainage Design Manual requirements. In-pit controls are regularly inspected and capacity maintained.	Rainfall event	Drainage Design Manual includes a review conducted of the current design criteria used to determine storage volumes. It focussed on assessing if the current basis of design for drainage design was appropriate. The review aimed to determine if the current criteria would hold the majority of historic rainfall events. A water balance tool was developed to assess performance. Rainfall data from Dwellingup BOM Station No 9538 for the period 1980 to 2021 and Wokalup Research Station daily evaporation was utilised to assess the suitability of the design criteria. This includes the significant rain event in 1982 associated with Cyclone Bruno, which had a daily rainfall of 160 mm and two-day rainfall of 218 mm. Drainage Protection Slots were not implemented at the time of this rainfall event. The model showed that, under the current design criteria of a 24 hours 1% AEP event with a constant 24 mm/day infiltration rate (within the Advisian 2022	• Regular compliance monitoring of pit capacity • Testwork of in-pit trenches (flooding and infiltration rate) has been undertaken.	Fully

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			derived 18 mm/day to 30mm/day infiltration rate range from literature and site observation), 99.7% of rainfall runoff would be captured over the period 1980 to 2021. Only several daily instances during the period 1990 to 2020 were predicted to show storage capacity exceedance assuming 24mm/day infiltration rate.		
		Significant Rainfall Event	From the same water balance modelling above, only several daily instances during the period 1980 to 2021 (includes Cyclone Bruno) were predicted to show storage capacity exceedance assuming 24mm/day infiltration rate.	• 15% contingency in pit capacity • Drainage Design Manual assumes fully saturated soil profile, with test work completed. • Monitoring of weather conditions in advance and adapting as required • Regular compliance monitoring of pit capacity	Predominantly
		High Slope	Historically (prior to 2020) steeper slopes were considered a higher risk area with drainage incidents in pits where insufficient capacity was allowed. However, revised pit capacity (as per Drainage Design Manual) is intended to rectify this gap. Greater surface water run-off velocity results in increased sediment movement within pit, which could impact storage capacity within pit. However, ongoing review ensures	• 15% contingency in pit capacity to allow for sedimentation • In-pit trenches increase pit capacity and water flow pathways, resulting in a decrease in surface water run off velocity • Regular compliance monitoring of pit capacity	Average

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			sufficient pit capacity. In-pit trenches are installed on the contour to increase pit capacity and increase water flow pathways, decreasing surface water run-off velocity and increased retention time for sedimentation. Increased water velocity is dissipated through the pit broken surface.		
		Extended Slope, large pits or upslope catchments (sub-catchment clearing)	High sub-catchment clearing and open areas may influence groundwater level and likelihood of a drainage event. In-pit trenches are installed on the contour to increase pit capacity and increase water flow pathways, decreasing surface water run-off velocity and increased retention time for sedimentation. Increased water velocity is dissipated through the pit broken surface.	• 15% contingency in pit capacity • In-pit trenches increase pit capacity and water flow pathways, resulting in a decrease in surface water run off velocity • Regular compliance monitoring of pit capacity • In-pit trenches are designed to segregate long slopes and large pits.	Average
		High Groundwater	Current groundwater mitigations (including monitoring of groundwater level, water management and associated 2m separation distance) are considered effective to avoid groundwater impacts to pit capacity. Whilst historical groundwater interactions may have occurred, these are not	• Any groundwater interactions are pumped out of the pit and utilised elsewhere. • Groundwater monitoring and investigations determine groundwater level prior to clearing. Ongoing groundwater monitoring will confirm a 2 m separation distance or other groundwater management measures will be implemented.	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			expected to commonly occur in future mining areas.		
		Close Proximity to Streamzone	In-pit trenches are installed on the contour to increase pit capacity and increase water flow pathways, decreasing surface water run-off velocity and increased retention time for sedimentation. Increased water velocity is dissipated through the pit broken surface.	• 100m Havel vegetation buffer provides a buffer to streamzone vegetation and streams	Average
Haul road infiltration and sediment sumps	Haul road sump capacity is designed to contain a 1% 72 hour AEP rainfall event. Sumps are regularly inspected and capacity maintained. Sump placement is determined by haul road catchment to ensure sufficient capacity. Additional sumps may be placed on high slope areas.	Rainfall event	Drainage Design Manual includes a review conducted of the current design criteria used to determine storage volumes. It focussed on assessing if the current basis of design for drainage design was appropriate. The review aimed to determine if the current criteria would hold the majority of historic rainfall events. A specific water balance tool, Sump Design Tool, was specifically developed for haul road sumps to assess performance. The hydrological design assumptions are slightly different between haul road storage and mine pit storage to recognise the system heterogeneity. Whereby the haul road storage catchment	• Sump maintenance • Water handling to ensure sump capacity is maintained. • Road maintenance – vehicle movement minimised during rainfall events to minimise road damage and sediment movement.	Predominantly
		Significant Rainfall Event		• Sump maintenance • Water handling to ensure sump capacity is maintained. • Road maintenance – vehicle movement minimised during rainfall events to minimise road damage and sediment movement.	Average
		High Slope		• Sump maintenance • Water handling to ensure sump capacity is maintained. • Greater frequency of sumps installed to minimize sub-catchment size.	Predominantly
		Extended Slope, large pits or upslope catchments (sub-catchment clearing)		• Sump maintenance • Water handling to ensure sump capacity is maintained. • Greater frequency of sumps installed to minimize sub-catchment size.	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
		High Groundwater	area (i.e. the haul road) is assumed to have zero infiltration while the mine pit storage catchment area is assumed to have a degree of infiltration due to the broken mining surface. Rainfall data from Dwellingup BOM Station No 9538 for the period 1980 to 2021 and Wokalup Research Station daily evaporation was utilised to assess the suitability of the design criteria. This includes the significant rain event in 1982 associated with Cyclone Bruno, which had a daily rainfall of 160 mm and two-day rainfall of 218 mm. The model showed that, under the current design criteria of a 72 hours 1% AEP event with a constant 50 mm/day infiltration rate, 90-95% of rainfall runoff predicted to be captured over the period 1980 to 2021. Where actual infiltration rate is 100 mm/day >99% of rainfall runoff predicted to be captured over the period 1980 to 2021.	• Sumps are pumped out as required with ongoing inspections occurring. • Groundwater monitoring and investigations determine groundwater level prior to clearing. Sumps are designed to avoid groundwater.	Predominantly
		Close Proximity to Streamzone	Whilst sedimentation accumulative may occur, ongoing maintenance (particularly prior to winter)	• 100m Havel vegetation buffer provides a buffer to streamzone vegetation and streams.	Average

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
			retains sump capacity. Historical drainage incidents have occurred where inadequate over-flow weirs were installed and if pits flowed into haul road catchments (i.e. inadequate sump capacity). This gap has been rectified within the Drainage Design Manual with haul road designed to be self-containing through the use of sumps and bunds to create contained catchments.		
Rehabilitation	Vegetated area decreases runoff. Rehabilitated areas are designed to be self-containing of any surface water run-off. Some minor erosion is expected in the first few years of rehabilitation establishment.	Rainfall event	No recent evidence of drainage incidents from rehabilitated areas. Minor erosion within recently rehabilitated areas is expected, however are self-stabilising (particularly with vegetation establishment) or remedial activities are undertaken to rectify.	• During rehab, managed via Environmental Red Alert Procedure • Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring	Predominantly
		Significant Rainfall Event		• During rehab, managed via Environmental Red Alert Procedure • Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring to identify any erosion, to allow remedial actions, if required.	Predominantly
		High Slope	-	• Potential to retain trenches and mining faces at base of rehabilitation until upslope rehabilitation is established and stabilised. • Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring	Predominantly
		Extended Slope, large pits or upslope catchments (sub-catchment clearing)	-	• Potential to retain trenches and mining faces at base of rehabilitation until upslope rehabilitation is established and stabilised.	Predominantly

Control	Control Description	Scenario/Risks	Evidence	Mitigating Actions	Effectiveness
				• Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring	
		Shallow Groundwater	Historical evidence and studies (as detailed in 2023-2027 MMP) that indicate that elevated groundwater during mining decreases following vegetation establishment.	• Pumping plan during rehab as required • Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring • Ongoing groundwater monitoring of high-risk pits with adaptive management, if required	Predominantly
		Shallow Regolith	Shallow regolith decreases the likelihood of long-term vegetation establishment, which may influence completion criteria associated with return of jarrah forest, and infiltration rates.	• Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring • Shallow regolith is mapped on a high level, however if within proximity, groundwater bores are utilised to confirm shallow regolith. • Shallow regolith is avoided as part of mine planning due to the decreased likelihood of long-term jarrah forest establishment. • If caprock or sub-surface granite is encountered, may be drill and blasted for landscaping to occur.	Average
		Close Proximity to Streamzone	No recent evidence of drainage incidents from rehabilitated areas. Minor erosion within recently rehabilitated areas is expected, however are self-stabilising (particularly with vegetation establishment) or remedial activities are undertaken to rectify.	• Rehabilitation design ensures containment of the specified design rainfall event • Ongoing rehabilitation monitoring	Average
